

You can **SNIP, GRIP and NIP** *(but not over 20 gauge!)*

Our exciting new pliers kits (**RFA-4080 and RFA-4081**) offer a perfect combination of tools for the electronics technician.

Please note that although these cutters are made of precision stainless steel, they are not designed to cut steel wire products. **Do NOT cut steel wire, paper clips or other similar wire products with these tools!** This may cause permanent damage to the cutting surfaces.

These cutters are intended for use only on soft copper wire or brass, not to exceed AWG 20. You will find that this covers most wire encountered in PCB and connector assembly applications. You would not use a jeweler's saw to cut pipe! If you use these tools for your copper cutting, cable trimming and PCB applications you will find that this set of fine cutters and pliers will last indefinitely.

This AWG 20 limit also applies to the **RFA-4084** "Gripper/Nipper" tool. Note that the finest feature of the RFA-4084 is its unique ability to hold the cut wire until released. Thanks to its treated spring steel wire catcher, you can count on no more wire flying free and littering your work area. This lead wire cutter means you can work more efficiently, more closely and more cleanly.
